

Cardiovascular Ultra-Miniature Single Sensor Mikro-Tip Pressure Transducer Catheters

Animal Use Only

Sensors.Systems.Solutions.®

Mikro-Tip Cardiovascular Catheters for Small Animals

Millar Instruments manufactures and markets a family of ultra-miniature reusable pressure catheters for use in small laboratory animals. The catheter body is narrower than the tip sensor to allow flexibility and to minimally obstruct the vessels or valves through which it passes. The sensor is side-mounted at the tip, and all models have straight tips. These ultra-miniature catheters range in size from 0.8 to 3.5 French and are available in usable lengths from 12 to 140 cm. (All catheter images are enlarged to show sensor position.)

SPR-249

SPR-407

SPR-612

SPR-671

Designed for animal research, the SPR-524 features advanced sensor design for maximum durability, drift of less than 3 mmHg per 24 hours and a versatile 3.5 French tip. This low-cost reusable catheter provides an affordable option to researchers requiring continuous high fidelity pressure measurement for up to seven days. The SPR-524 is often used to monitor pressures in the left atrium or ventricle; however, it may also be used in a variety of other animal research applications. (All catheter images are enlarged to show sensor position.)

SPR-524

NOTE: The SPR-524 is non-repairable and is warranted for 30 days against defects in materials and workmanship.
